Code Sentinel Data

Free Sample — Triple Trap Dataset v2

A true row subset of the full dataset, not a re-generation

SAMPLE PASSPORT

SAMPLE SIZE	336 rows of `screen_outcomes` — 12 real lines + 25 synthetic profiles + 20 virtual normals, × 8/8/2 conditions
RELATION TO FULL DATASET	True subset of rows already present in the full 81,024-row dataset — not regenerated, not re-sampled
SCHEMA	Identical column schema to `screen_outcomes.parquet` in the full delivery
PRICE	Free, no registration

> **IN SILICO MODEL PREDICTIONS — NOT EXPERIMENTAL DATA.** Evidence class is given per row in the `data_type` column. Not patient or clinical data; not for clinical decisions. See the full dataset passport for the complete evidence breakdown.

01 · WHAT THIS IS

A Real Subset, Not a Demo Regeneration

This is a free sample of the full Triple Trap Dataset v2. The sample is a genuine row subset pulled directly from the full dataset's `screen_outcomes.parquet` — the same rows a buyer would receive, not a separately regenerated approximation. Column schema is identical to the full dataset, so code written against the sample runs unchanged against the paid delivery.

Segment	Profiles	Conditions	Rows
Real lung-cancer cell lines (DepMap 25Q3)	12	8	96
Synthetic profiles	25	8	200
Virtual normal cells	20	2	40
Total	57	—	**336**

02 · STATUS AND LABELING

What's Real and What's Modeled

> **IN SILICO MODEL PREDICTIONS — NOT EXPERIMENTAL DATA**
>
> Every outcome row here is a prediction from the Triple Trap ODE model, not a measured wet-lab result. The 12 real cell lines contribute real DepMap 25Q3 expression and genotype context to the model's input — the outcome itself is still simulated. The evidence class for each row is stated directly in the `data_type` column. This sample is not patient data and not clinical evidence, and must not be represented as either.

03 · CONTENTS

Files in This Sample

File	Description
`sample_screen_outcomes.parquet`	336 rows: outcomes, parameters and cohort annotation — primary file, identical schema to the full dataset
`sample_screen_outcomes.csv`	The same 336 rows as a direct CSV mirror of the Parquet file, for Excel/Sheets
`sample_real_cell_lines.csv`	96 rows — the real-DepMap-anchored subset only (12 lines × 8 conditions), for a quick look at the ground-truth-adjacent rows without filtering the full file
`sample_outcomes_summary.csv`	18-row aggregate: death count and death rate by cohort × condition, computed directly from the sample
`HOW_TO_USE_PARQUET.txt`	How to open and work with the Parquet format

04 · QUICK-LOOK RESULTS

What the 336 Rows Show

These numbers come from the sample's own 336 rows, not the full dataset. At 12 real lines, they are an illustration of what the columns mean — not a statistically powered result. The full-dataset passport (123 real lines, 10,123 profiles) carries the actual validated findings.

Cohort	Condition	n	Deaths	Death rate
Real	control	12	0	0%
Real	valve4 (four-valve blockade)	12	10	83%
Real	triple_trap (full protocol)	12	12	100%
Virtual normal	triple_trap (full protocol)	20	20	100%

The full breakdown by cohort and all 8 conditions is in `sample_outcomes_summary.csv`.

05 · HOW TO USE THESE FILES

`HOW_TO_USE_PARQUET.txt` covers opening the Parquet file directly in Python, R or DuckDB. The two CSV files need no special tooling — open them in Excel, Google Sheets, or any spreadsheet application.

06 · TERMS

Free of charge, no registration. For evaluation, education, and methods development. Must not be represented as experimental or clinical data. The full dataset includes 8 Parquet files, `schema.json`, a technical passport, and EN/RU documentation; a generator with a demo version is also available.
